Flexibility and strength of the penile suspensory ligaments. Several ligaments are important for maintaining penile rigidity. These ligaments include the suspensory ligament, the penile ligaments, the dorsal ligaments, the transverse ligament, the corpora cavernosa, the tunica albuginea, and the corporal fascia. By identifying the structures of the erectile complex, we can easily comprehend the causes of erectile dysfunction. To identify the anatomy and evaluate the anatomy of the erectile complex of the penis. The evaluation of the anatomy was done using cadaveric penises. A total of 30 cadaveric penises were used in this study. The length, thickness, and width of each structure in the erectile complex were measured. The average length, thickness, and width of the suspensory ligament were 9.4 ± 0.93 cm, 2.25 ± 0.21 mm, and 5.5 ± 0.31 mm, respectively. The average length, thickness, and width of the dorsal ligaments were 5.7 ± 0.55 cm, 1.87 ± 0.18 mm, and 2.7 ± 0.23 mm, respectively. The average length, thickness, and width of the transverse ligament were 4.5 ± 0.42 cm, 1.38 ± 0.15 mm, and 2.14 ± 0.2 mm, respectively. The average length, thickness, and width of the tunica albuginea were 8.8 ± 0.69 cm, 0.89 ± 0.1 mm, and 1.76 ± 0.16 mm, respectively. The average length, thickness, and width of the corpora cavernosa were 5.6 ± 0.5 cm, 2.27 ± 0.22 mm, and 5.3 ± 0.39 mm, respectively. The average length, thickness, and width of the corporal fascia were 11.05 ± 0.97 cm, 1.79 ± 0.17 mm, and 3.9 ± 0.36 mm, respectively.
